Assigning Preset Modes to Applications

The **Auto Mode** tab allows you to associate a specific **Preset Mode** with a specific application, and apply it automatically. When **Auto Mode** is enabled, Dell Display Manager automatically switches to the corresponding **Preset Mode** whenever the associated application is activated. The **Preset Mode** assigned to a particular application may be the same on each connected display, or it can vary from one display to another.

Dell Display Manager is pre-configured for many popular applications. To add a new application to the assignment list, simply drag the application from the desktop, Windows Start Menu, or elsewhere, and drop it onto the current list.

NOTE: Preset Mode assignments for batch files, scripts, loaders, and nonexecutable files such as zip archives or packed files, are not supported.

You can also configure the Game preset mode to be used whenever a Direct3D application runs in full-screen mode. To prevent an application from using mode, assign a different preset mode to it.

NOTE: DDM communicates with your display even when the display is displaying video from another computer. You can install DDM on the computer you frequently use and control input switching from it. You may also install DDM on other computers connected to the display.

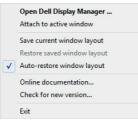

Restoring Application Positions

DDM can help you restore application windows into their positions when you reconnect your computer to the display(s). You can quickly access to this feature by right-clicking on DDM icon in the notification tray.

If you choose "**Auto-restore window layout**", your application windows' positions are tracked and remembered by DDM. DDM automatically puts the application windows into their original positions when you reconnect your computer to your display(s).

If you want to go back to a favorite layout after you have moved the application windows around, you can first "Save current window layout" and later "Restore saved window layout".

| Open Dell Display Manager Attach to active window |
|--|
| Save current window layout |
| Restore saved window layout |
| Auto-restore window layout |
| Online documentation |
| Check for new version |
| Exit |

You may use displays with different models or resolutions in your daily routine, and you may apply different window layouts on them. DDM is able to know the display you have reconnected and restore application positions accordingly.

In case you need to replace a display in a display matrix configuration, you can save the window layout before replacement and restore the layout after a new display is installed.

NOTE: You should keep your applications running in order to benefit from this feature. DDM doesn't launch applications.

Troubleshooting

If DDM does not work with your display, DDM will show below icon in your notification tray.

Click on the icon, DDM shows a more detailed error message.

Please note that DDM only works with Dell branded displays. If you are using displays from other manufacturers, DDM doesn't support them.

If DDM is unable to detect and/or communicate with a supported Dell display, please take below actions to troubleshoot:

- **1.** Make sure the video cable is properly connected to your display and your computer. especially the connectors should be firmly inserted into position.
- 2. Check the display OSD to ensure DDC/CI is enabled.
- **3.** Make sure you have the correct and latest display driver from the graphics vendor (Intel, AMD, NVidia, etc.). Display driver is often the cause of DDM failure.
- 4. Remove any docking stations or cable extenders or converters between the display and the graphics port. Some low-cost extenders, hubs or converters may not support DDC/ Cl properly and can fail DDM. Update the driver of such device if the latest version is available.
- 5. Restart your computer.

DG

DDM may not work with below displays:

- Dell display models earlier than year 2013 and D-series of Dell displays. For more information see www.dell.com/support/monitors.
- Gaming displays using Nvidia-based G-sync technology
- · Virtual and wireless displays do not support DDC/CI
- Some early models of DP 1.2 displays, it may be necessary to disable MST/DP 1.2 using the display OSD

If your PC is connected to the Internet, you will be prompted to upgrade to a newer version of DDM when it is available. It is recommended to download and install the latest DDM application.

You may also check for new version by right clicking on DDM icon while pressing and holding 'shift' key.
